

# Dynamic Causal Modelling for EEG and MEG

Stefan Kiebel

TECHNISCHE  
UNIVERSITÄT  
DRESDEN

# Overview

1 M/EEG analysis

2 Dynamic Causal Modelling – Motivation

3 Dynamic Causal Modelling – Generative model

4 Bayesian inference

5 Applications

# Overview

1 M/EEG analysis

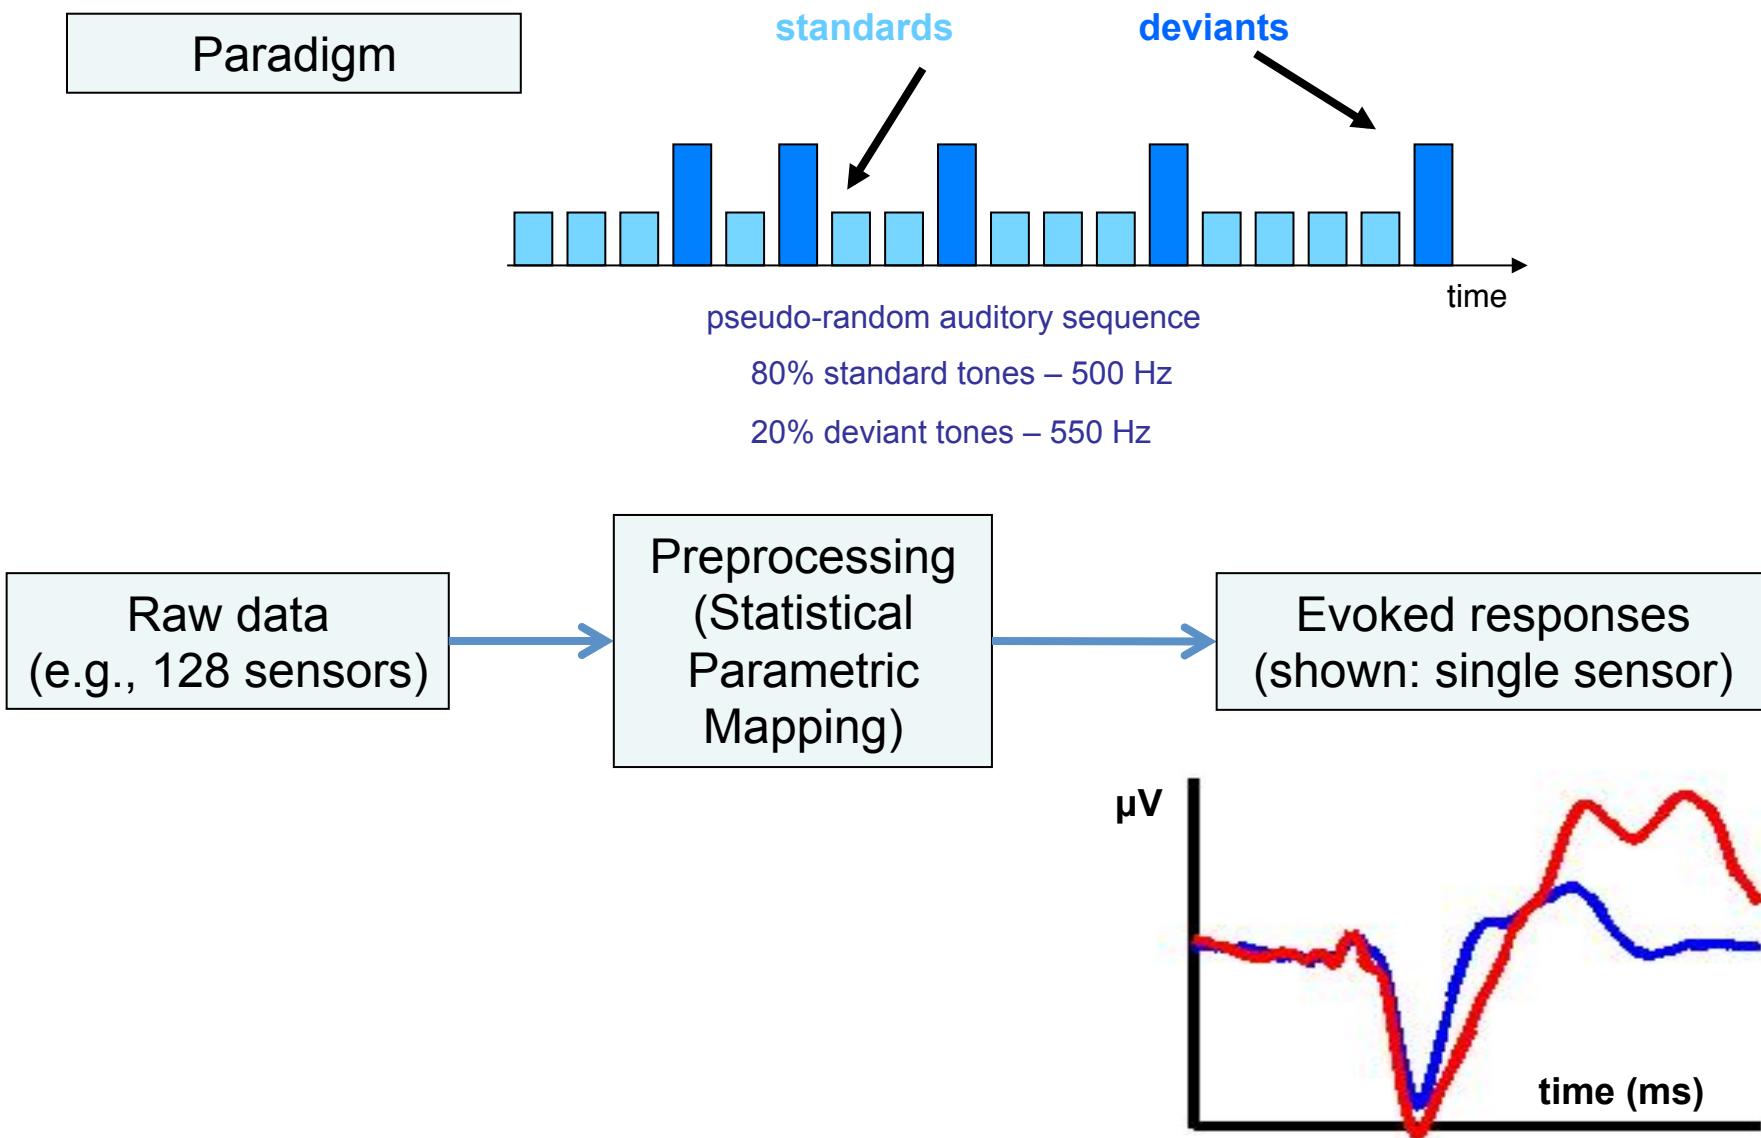

2 Dynamic Causal Modelling – Motivation

3 Dynamic Causal Modelling – Generative model

4 Bayesian inference

5 Applications

# Mismatch negativity (MMN)

Garrido et al., *NeuroImage*, 2007

# Overview

1 M/EEG analysis

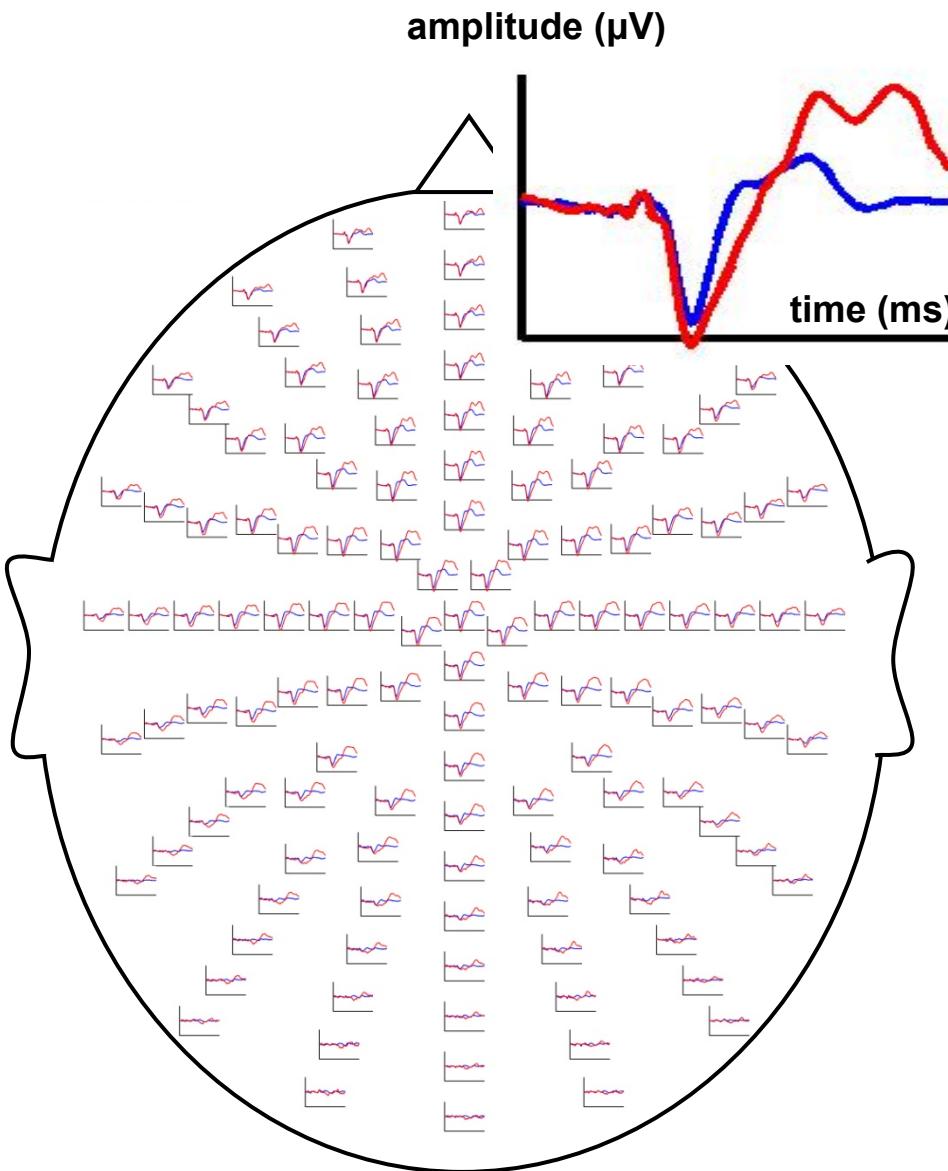

**2 Dynamic Causal Modelling – Motivation**

3 Dynamic Causal Modelling – Generative model

4 Bayesian inference

5 Applications

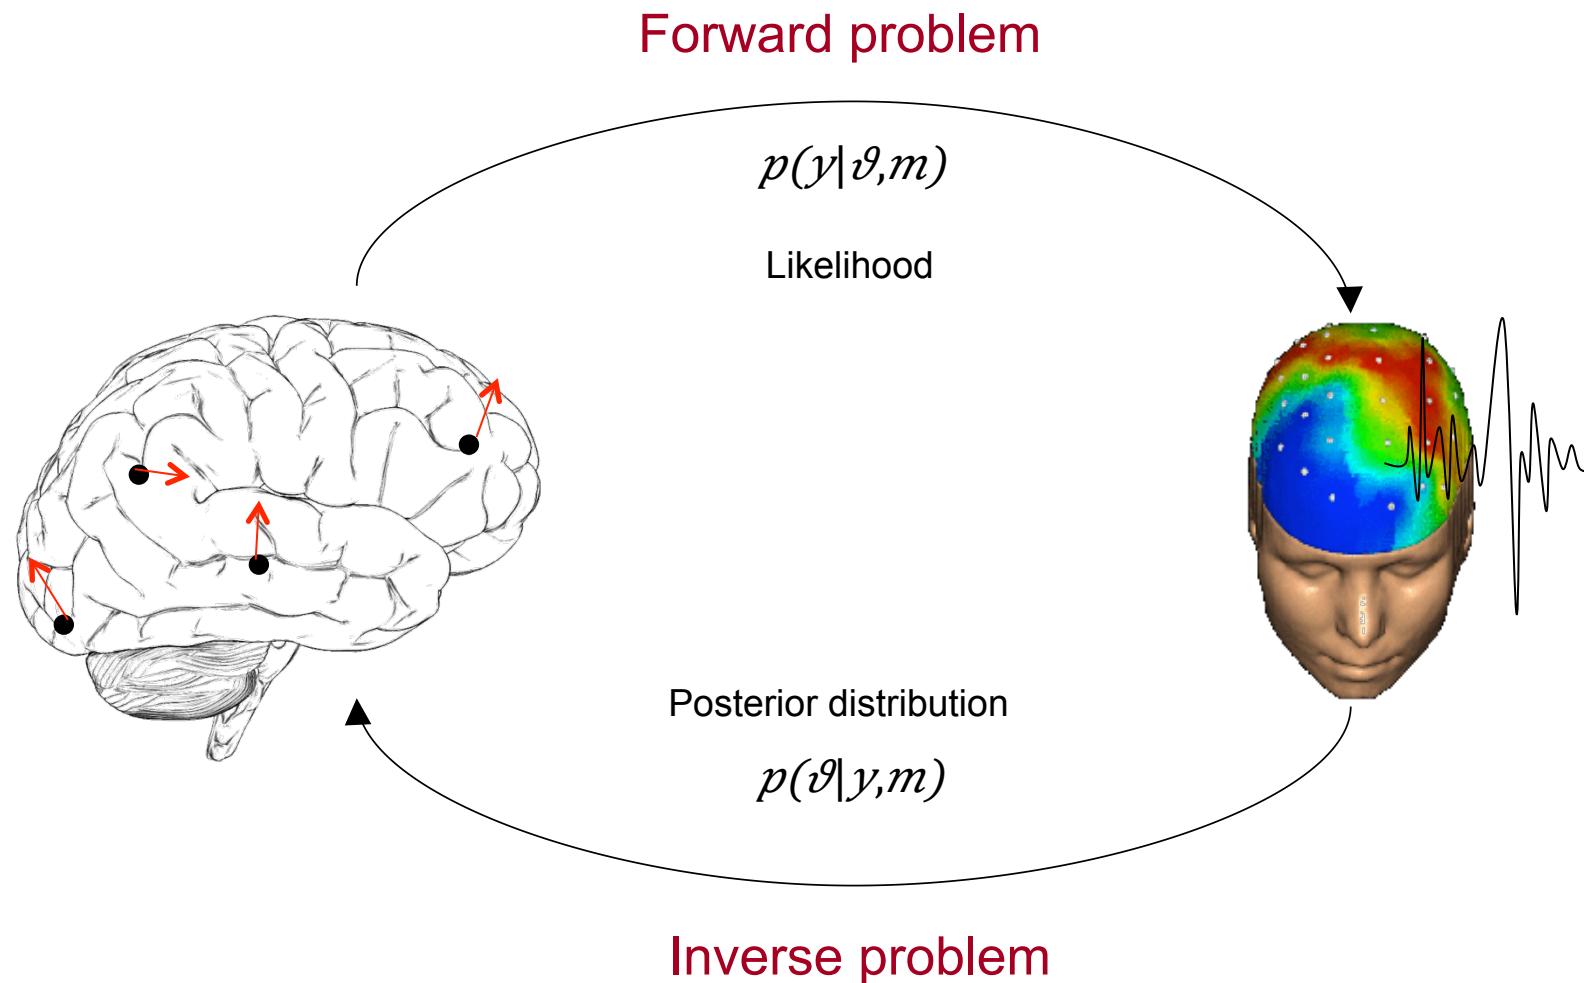

# Electroencephalography (EEG)

Modelling aim:  
Explain **all** data with few parameters

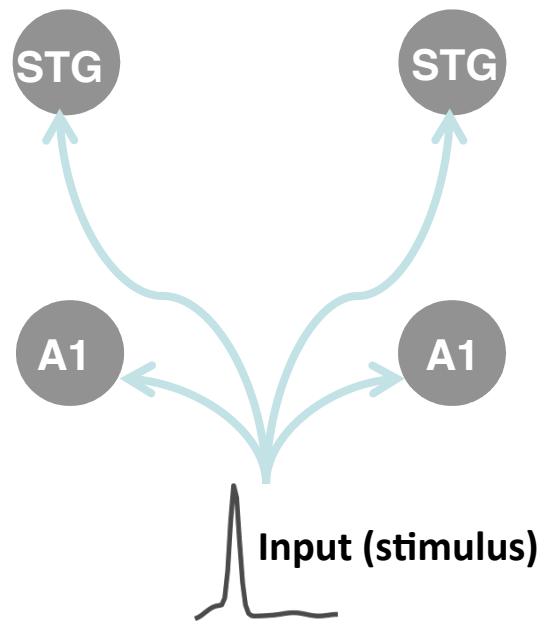

How to:  
Assume data are caused by few interacting brain sources

# Probabilistic inference

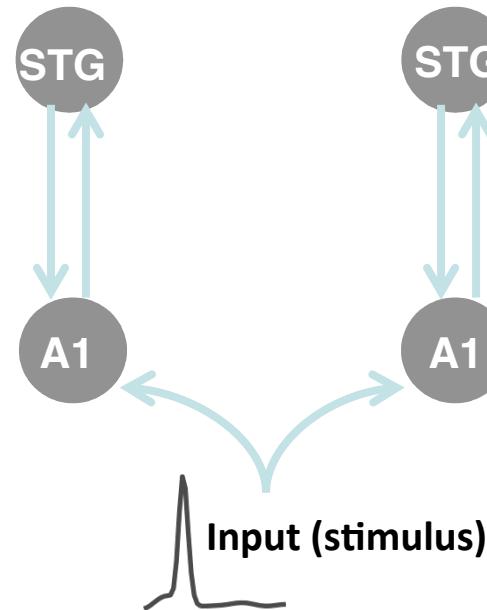

# Cognitive neuroscience

**Conventional analysis:**  
Which regions are involved in task?

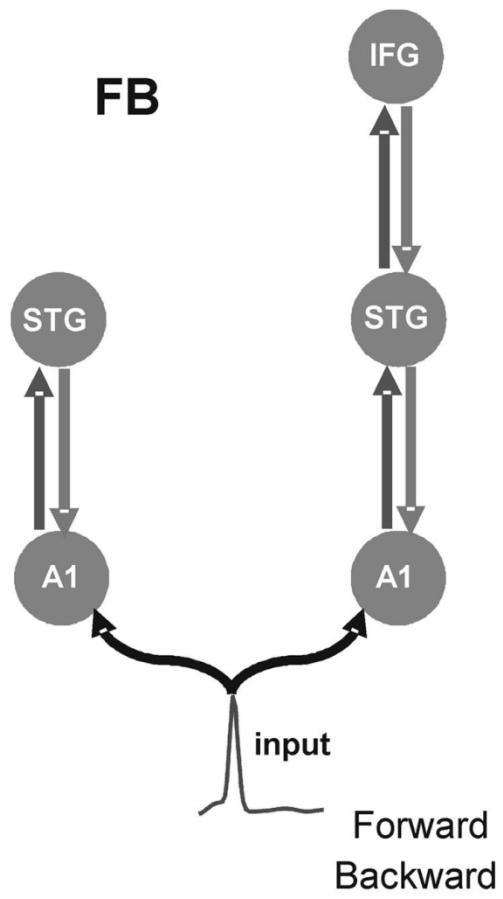

**DCM analysis:**  
How do regions communicate?

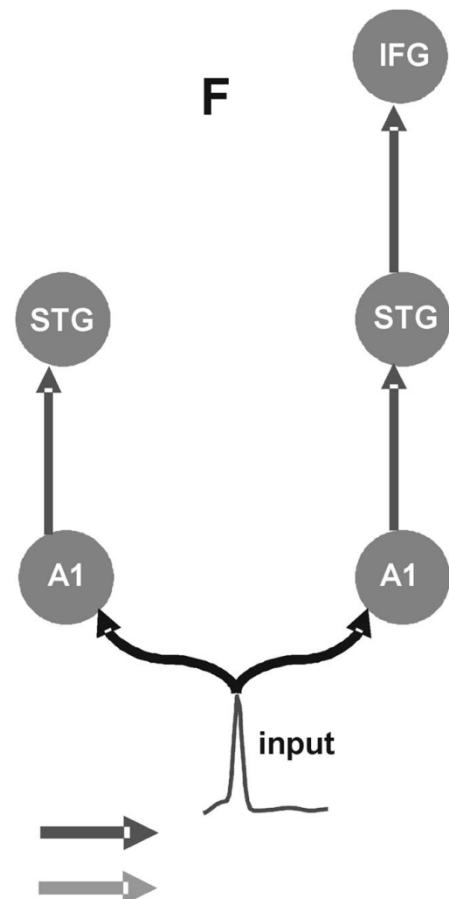

# Model for auditory evoked response

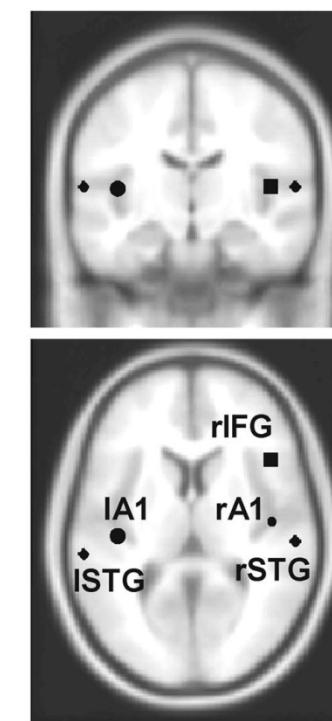

A  
with backward connections

B  
and without

C

Garrido et al., PNAS, 2007

# Overview

1 M/EEG analysis

2 Dynamic Causal Modelling – Motivation

**3 Dynamic Causal Modelling – Generative model**

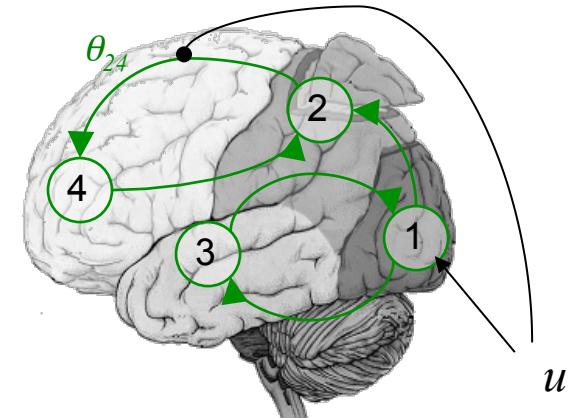

4 Bayesian inference

5 Applications

# The DCM approach

- DCM: model structure

$$\begin{cases} y = g(x, \varphi) + \varepsilon \\ \boldsymbol{x} = f(x, u, \theta) \end{cases} \stackrel{\text{likelihood}}{\Rightarrow} p(y | \theta, \varphi, m)$$

- DCM: Bayesian inference

parameter estimate:

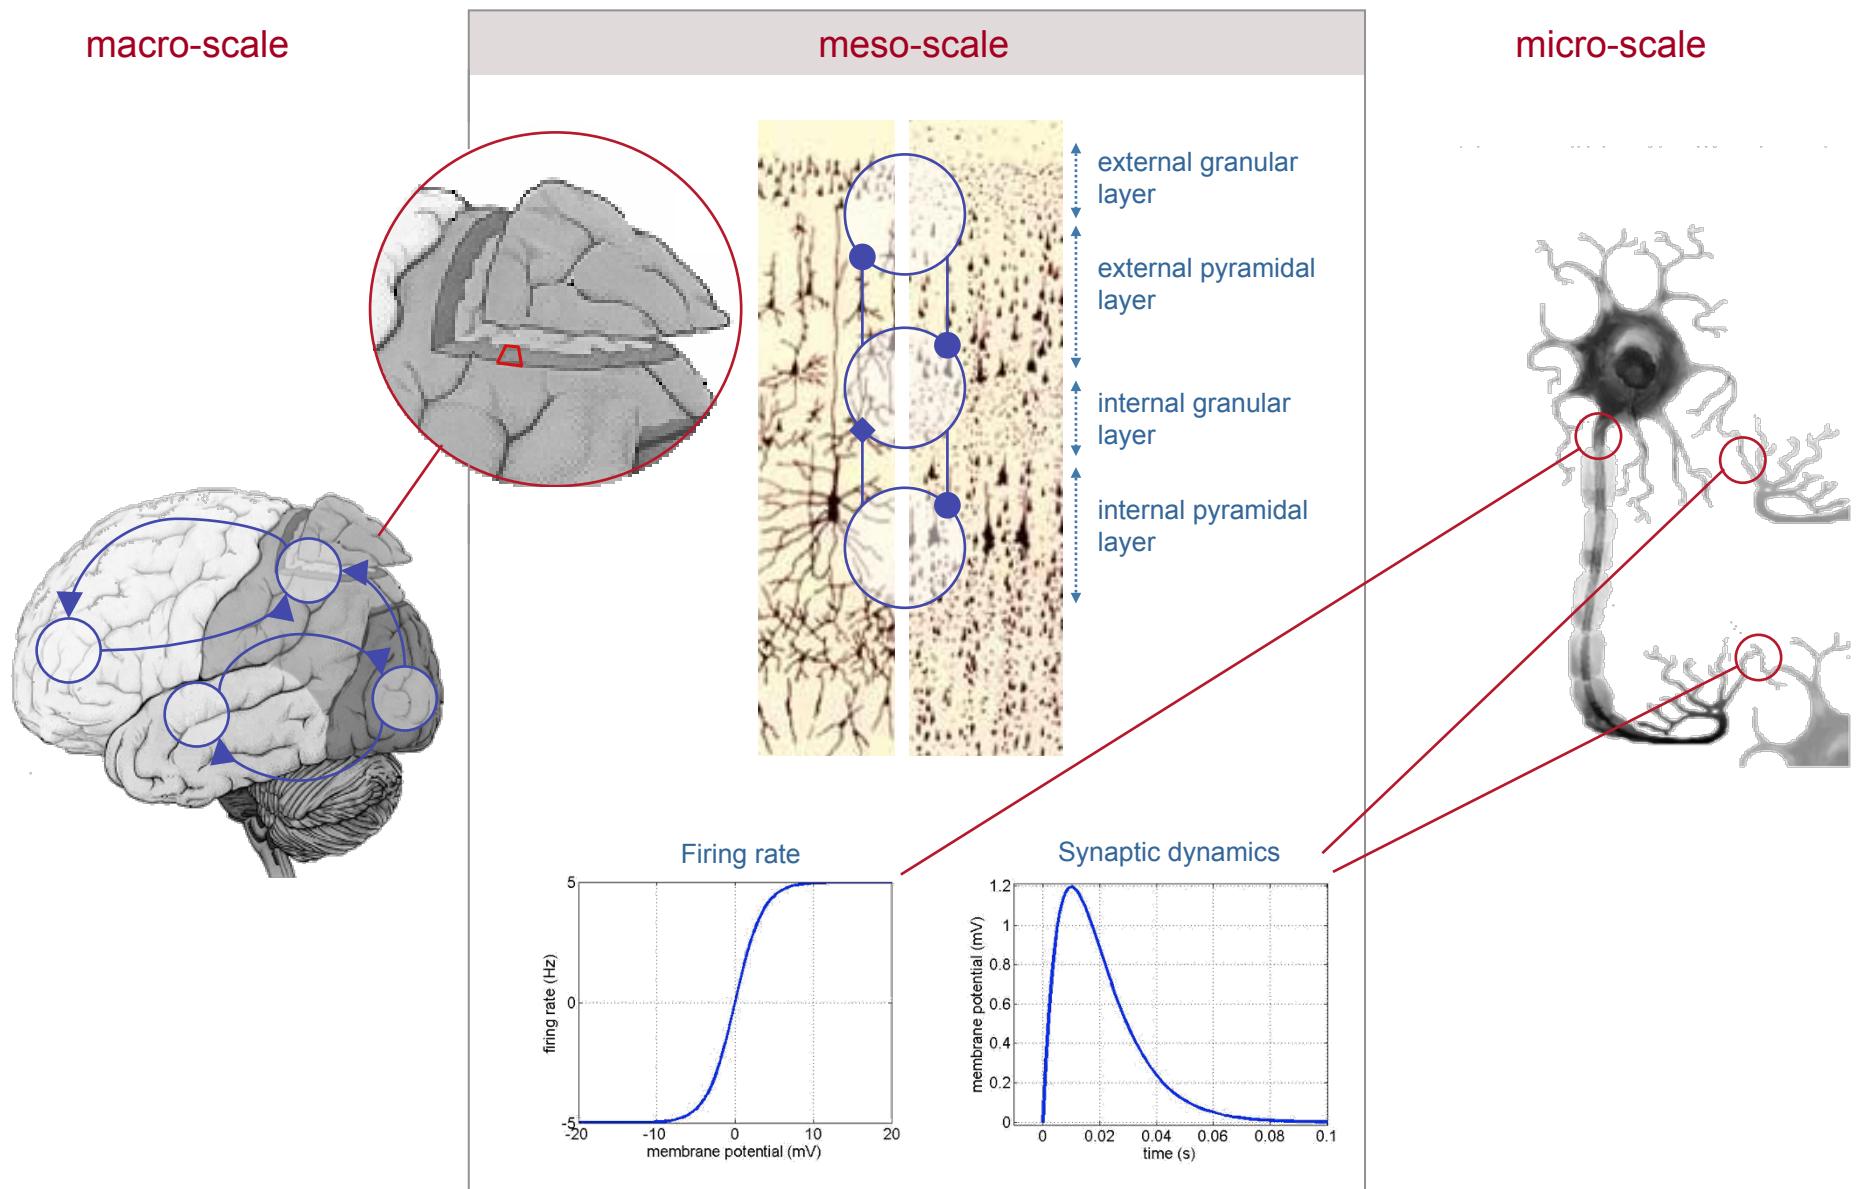

$$\hat{\theta} = E[\theta | y, m]$$

model evidence:

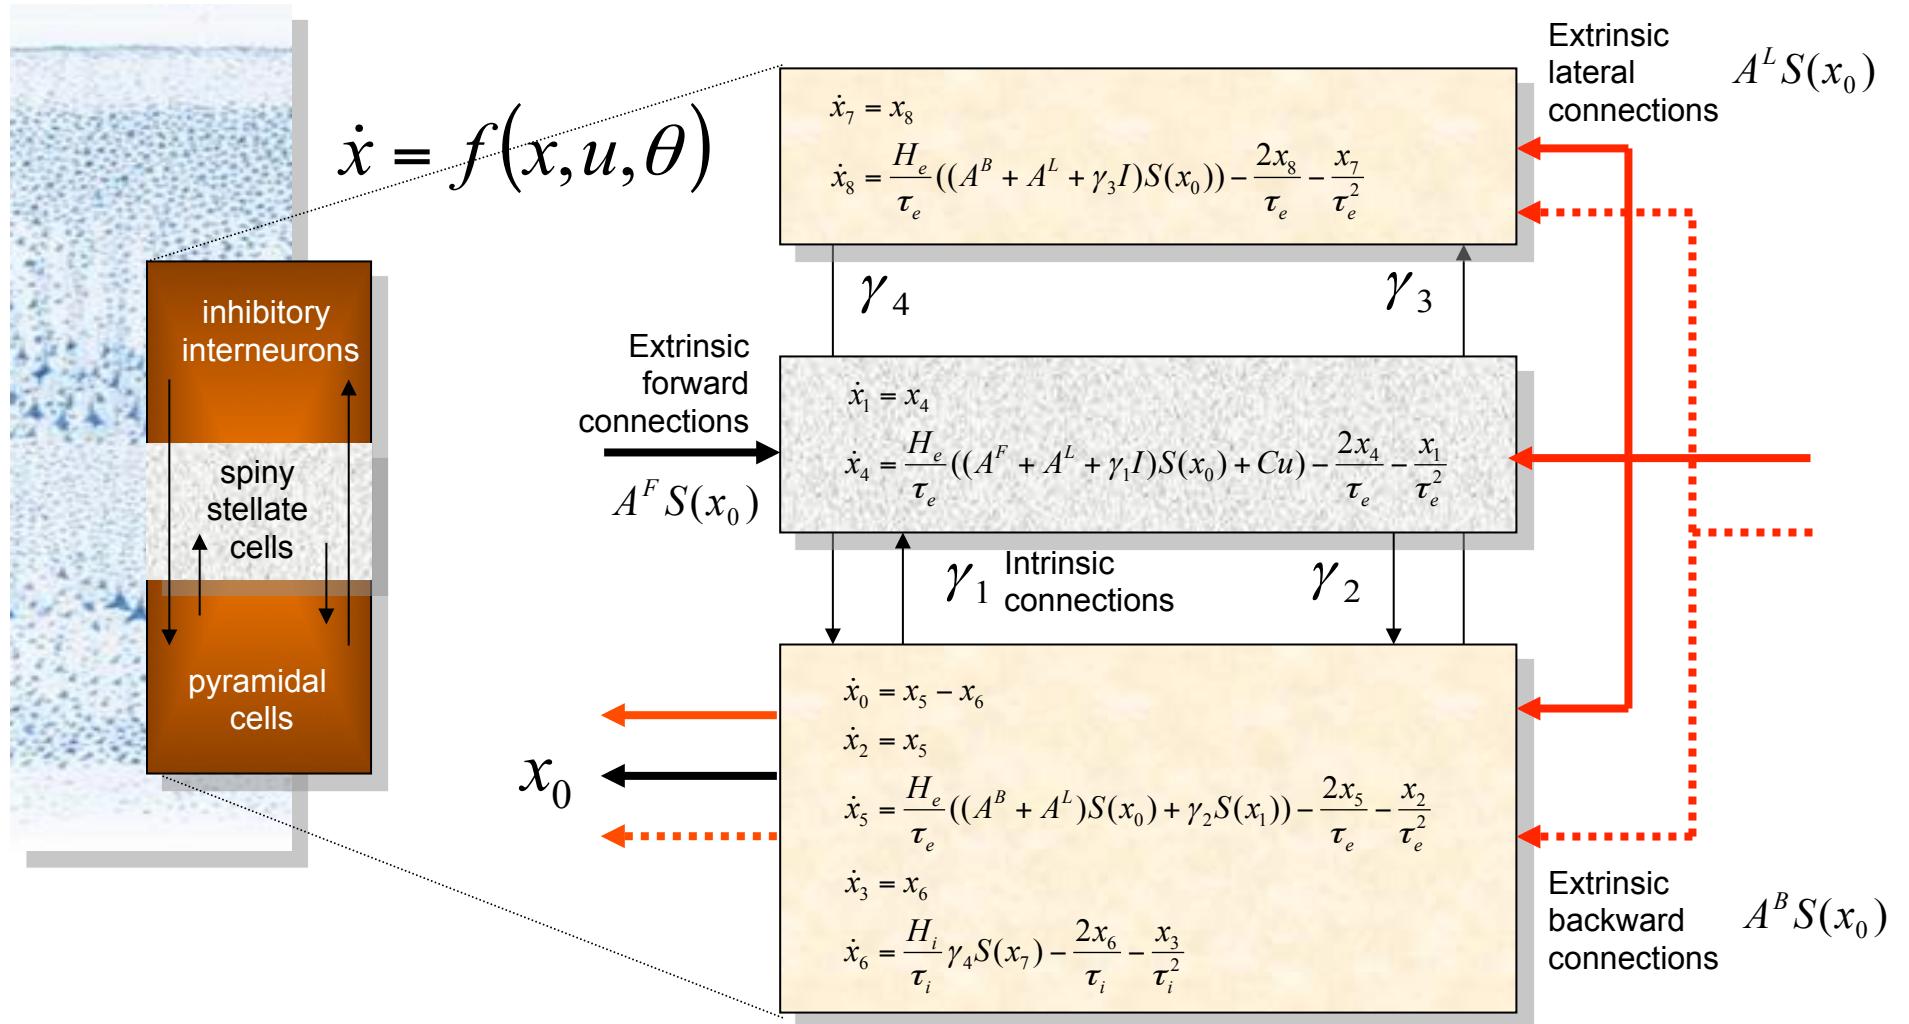

$$p(y | m) = \int p(y | \theta, \varphi, m) p(\theta | m) p(\varphi | m) d\varphi d\theta$$

priors on parameters

DCM for steady-state responses

DCM for induced responses

DCM for phase coupling

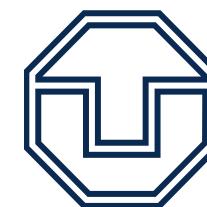

# Summary

- Dynamic Causal Modelling tests hypotheses about how brain sources communicate.
- Differences between conditions or groups are modelled as modulation of connectivity.
- Bayesian model comparison to identify best model among alternative, plausible models.
