

# Cooperative atom-light interaction in a blockaded Rydberg ensemble

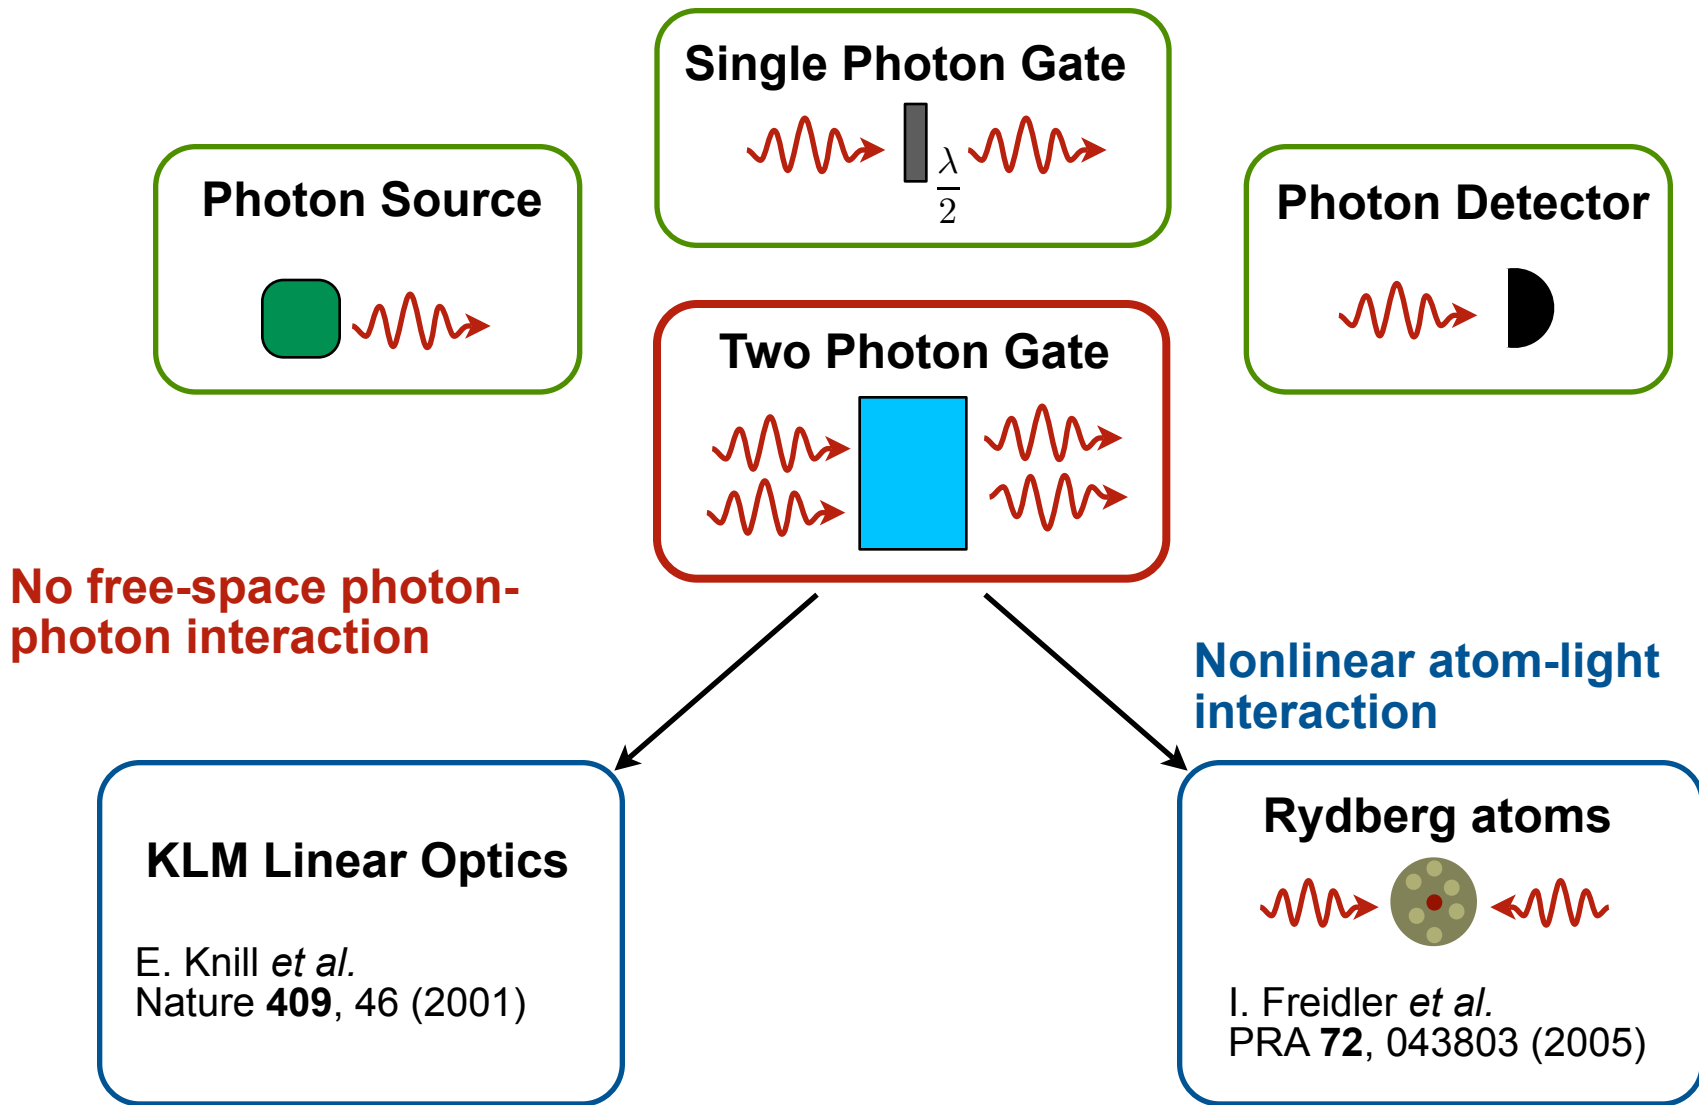

Jonathan Pritchard

University of Durham, UK

- 1. Cooperative optical non-linearity due to dipole-dipole interactions**
- 2. Observation of cooperativity in an ultra-cold Rydberg ensemble**
- 3. Towards single photon non-linearities**

Optical response expressed in terms of complex susceptibility:

$$\chi = \chi^{(1)} + \chi^{(2)} \mathcal{E} + \chi^{(3)} \mathcal{E}^2 + \dots$$

Observe back-action on light :

**Transmission**  $T = \exp\{-k\chi_I l\}$

**Dispersion**  $\Delta\phi = k\chi_R l/2$

Consider a three level atom in ladder EIT scheme

On resonance eigenstate is:

$$|\Psi\rangle = \frac{(\Omega_p^2 + \Gamma_e^2)^{1/2}|g\rangle - \Omega_p|e\rangle}{2(\Omega_p^2/2 + \Gamma_e^2/4)^{1/2}} \quad |\Psi\rangle = \left| \begin{array}{c} \bullet \\ \updownarrow \\ \bullet \end{array} \right\rangle$$

Susceptibility:

Consider a three level atom in ladder EIT scheme

On two-photon resonance populate **dark state**:

$$|\Psi_D\rangle = \frac{\Omega_c|g\rangle - \Omega_p|r\rangle}{(\Omega_p^2 + \Omega_c^2)^{1/2}}$$

M. Fleischhauer *et al.*, RMP **77**, 633 (2005).

Susceptibility:

**Intensity dependent**

**Giant Kerr  $\chi^{(3)}$**

H. Schmidt and A. Imamoglu  
Opt. Lett. **21**, 1936 (1996)

A. Mohapatra *et al.*  
Nature Phys. **4**, 890 (2008)

Apply Kerr effect to two photon gate:

Phase shift changes across envelope - destroys fidelity

*Single-photon Kerr non-linearities do not help quantum computation,*  
J. H. Shapiro, PRA **76**, 062305 (2006)

*Impossibility of large phase shift via the giant Kerr effect with single photon wavepackets,*  
J. Gea-Banacloche, PRA **81**, 043823 (2010).

⇒ **Require novel non-linearity**

## “Ordinary” Non-linearity

Single dipole   $\chi_1$

Two dipoles  +  → **Dipoles Independent**   $\chi = 2\chi_1$

From single dipole response derive response of ensemble  $\chi = N\chi_1$

## Cooperative non-linearity

Introduce strong dipole-dipole interactions

Two dipoles  +  → **Dipoles Correlated**   $\chi \neq 2\chi_1$

**Optical response of single dipole modified by neighbouring dipoles**

Cooperativity requires strong dipole-dipole interactions  $\Rightarrow$  **Rydberg Atoms**

Dipole moment  $\mu \propto n^2$

Interaction  $V(R) = -\frac{C_6}{R^6} \propto n^{11}$

'Strong' dipole-dipole interactions  $\Rightarrow$  **Blockade**  $V(R) > \Omega_c$

Blockade radius

$$R_b = \sqrt[6]{\frac{C_6}{\Omega_c}} \simeq 5 \mu\text{m} \quad (60S_{1/2}, \Omega_c \sim 4 \text{ MHz})$$

Average Number of atoms / blockade

$$\bar{N}_b = 4/3\pi R_b^3 \rho$$

Consider a pair of atoms  $R \gg R_b$

Atom 1

Atom 2

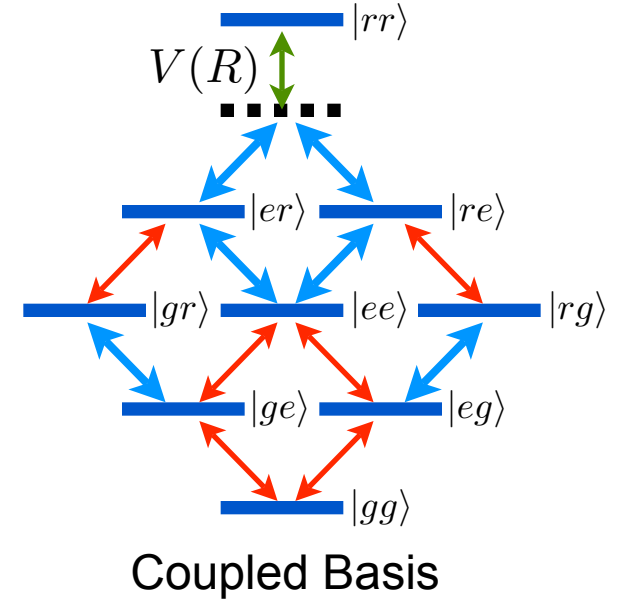

Coupled Basis

Large separation : Observe ordinary dark state  $|\Psi_D\rangle = |\psi_D\rangle_1 \otimes |\psi_D\rangle_2$

Move atoms closer  $R < R_b$

$V(R) \gg \Omega_c$  : Blockade creates new state  $|\Psi\rangle$

D. Møller *et al.* PRL **100**, 170504 (2008)

$$|\Psi\rangle = \left| \begin{array}{c} \text{Atom 1} \\ |g\rangle_1 \\ |e\rangle_1 \\ |r\rangle_1 \end{array} , \begin{array}{c} \text{Atom 2} \\ |g\rangle_2 \\ |e\rangle_2 \\ |r\rangle_2 \end{array} \right\rangle + \left| \begin{array}{c} \text{Atom 1} \\ |g\rangle_1 \\ |e\rangle_1 \\ |r\rangle_1 \end{array} , \begin{array}{c} \text{Atom 2} \\ |g\rangle_2 \\ |e\rangle_2 \\ |r\rangle_2 \end{array} \right\rangle$$

**Tunable cooperative atom-light interaction**  $\Rightarrow \Omega_c, \Omega_p, V(R)$

Cooperative atom-light interaction in a blockaded Rydberg ensemble,

MPIPKS Workshop, Dresden 2010

1. Cooperative optical non-linearity due to dipole-dipole interactions
2. Observation of cooperativity in an ultra-cold Rydberg ensemble
3. Towards single photon non-linearities

### EIT Locking Scheme

R. P. Abel *et al.*, Appl. Phys. Lett. **94**, 071107 (2009)

### Choice of Rydberg State

$$V(R) > \Omega_c > \Omega_p$$

$$C_6 \propto n^{11} \quad \Omega_c \propto n^{-3/2} \Rightarrow n = 50 - 60$$

### Experimental Setup

$^{87}\text{Rb}$  atoms prepared in  $5S_{1/2} |F = 2, m_F = 2\rangle$

$$P_{780} \sim 1 \text{ pW} - 3 \text{ nW}$$

$$w_0 = 12 \text{ } \mu\text{m}$$

$$P_{480} \sim 50 \text{ mW}$$

$$w_0 = 66 \text{ } \mu\text{m}$$

Scan probe  $\Delta_p/2\pi = -20 \rightarrow 20 \text{ MHz}$  in  $500 \text{ } \mu\text{s}$

K. J. Weatherill *et al.*, J. Phys. B **41**, 201002 (2008).

Record transmission for  $60S_{1/2}$  at  $\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3}$

$$\Omega_c/2\pi = 0$$

Data recorded from 100 averages

Weak probe :

J. D. Pritchard *et al.* arXiv:1006.4087 (2010)

Record transmission for  $60S_{1/2}$  at  $\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3}$

$$\Omega_c/2\pi \sim 4.8 \text{ MHz}$$

Data recorded from 100 averages

Weak probe : No Rydberg population

**Narrow probe of Rydberg state frequency**

J. D. Pritchard *et al.* arXiv:1006.4087 (2010)

Record transmission for  $60S_{1/2}$  at  $\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3}$

$\Omega_c/2\pi \sim 4.8 \text{ MHz}$

+ Suppression

J. D. Pritchard *et al.* arXiv:1006.4087 (2010)

Record transmission for  $60S_{1/2}$  at  $\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3}$

$\Omega_c/2\pi \sim 4.8 \text{ MHz}$

+ Suppression  
+ No broadening

J. D. Pritchard *et al.* arXiv:1006.4087 (2010)

Record transmission for  $60S_{1/2}$  at  $\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3}$

$\Omega_c/2\pi \sim 4.8 \text{ MHz}$

+ Suppression  
+ No broadening  
+ No shift

J. D. Pritchard *et al.* arXiv:1006.4087 (2010)

**Observations:** Suppression

No Shift

No Broadening

**Mechanisms:**

- Ion Creation
- Mean-field interaction
- Van der Waals dephasing
- Cooperative Nonlinearity

**Observations:** Suppression

No Shift

No Broadening

**Mechanisms:**

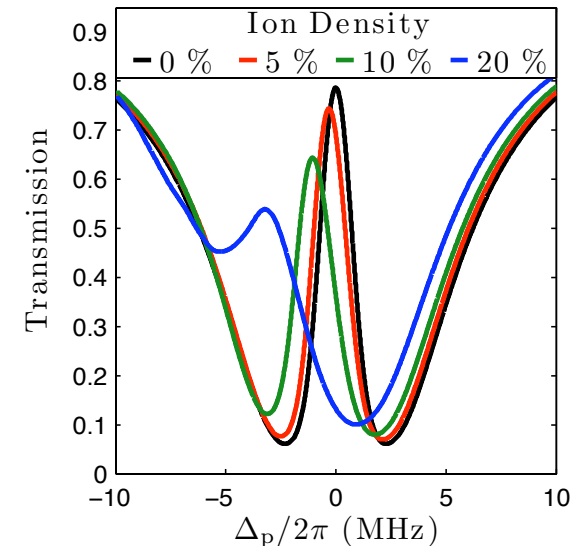

- **Ion Creation**
- Mean-field interaction
- Van der Waals dephasing
- Cooperative Nonlinearity

Stark shift of atom  $i$

$$\Delta_{\text{ion}}^i = -\frac{1}{2}\alpha_0 \sum_j^{N_{\text{ion}}} \mathcal{E}^2(R_{ij})$$

**Ions cause red shift and broadening**

**Observations:** Suppression

No Shift

No Broadening

**Mechanisms:**

- ~~Ion Creation~~
- **Mean-field interaction**
- Van der Waals dephasing
- Cooperative Nonlinearity

Dipole-dipole shift of atom  $i$

$$\Delta_{\text{dd}}^i = \sum_{i \neq j}^N -\frac{C_6}{R_{ij}^6}$$

**Mean-field causes blue shift and broadening**

H. Schempp *et al.* PRL **104**, 173602 (2010)

**Observations:** Suppression

No Shift

No Broadening

**Mechanisms:**

- ~~Ion Creation~~
- ~~Mean-field interaction~~
- **Van der Waals dephasing**
- Cooperative Nonlinearity

Dephasing Rate

$$\gamma' = \gamma_{\text{vdW}} N_r$$

Fit 60S data:  $\gamma_{\text{vdW}} \sim 7\Gamma_e$

**vdW predicts significant broadening**

M. Gross and S. Haroche Phys. Rep. **93**, 301 (1982)

**Observations:** Suppression

No Shift

No Broadening

**Mechanisms:**

- ~~Ion Creation~~
- ~~Mean-field interaction~~
- ~~Van der Waals dephasing~~
- **Cooperative Nonlinearity**

Require model for all atoms in blockade

$$\rho \sim 1.2 \times 10^{10} \text{ cm}^{-3} \Rightarrow \bar{N}_b \sim 9$$

**Too big to model!**

Reduce atomic density

$\rho \sim 0.35 \times 10^{10} \text{ cm}^{-3} \Rightarrow \bar{N}_b \sim 3$  **Require 3-atom model**

$\Omega_p/2\pi$  (MHz) :    1.1                    2.0                    3.2

Three Atom Coupled Basis

Blockaded States

Entangled state on two-photon resonance:

$$|\Psi\rangle = \left| \begin{array}{ccc} \text{[Diagram 1]} \\ \text{[Diagram 2]} \\ \text{[Diagram 3]} \end{array} \right\rangle + \left| \begin{array}{ccc} \text{[Diagram 4]} \\ \text{[Diagram 5]} \\ \text{[Diagram 6]} \end{array} \right\rangle + \left| \begin{array}{ccc} \text{[Diagram 7]} \\ \text{[Diagram 8]} \\ \text{[Diagram 9]} \end{array} \right\rangle$$

Model transmission using Liouville eq.  $\dot{\sigma} = \frac{i}{\hbar} [\sigma, \mathcal{H}] - \gamma\sigma$

**Parameters: weak-probe data**

$\Omega_c/2\pi = 3.8$  MHz

$\gamma_{gr}/2\pi = 110$  kHz

Interaction strength:

$V/2\pi = 15$  MHz

**Cooperative Nonlinearity :**

- ✓ Suppression
- ✓ No Shift
- ✓ No Broadening

J. D. Pritchard *et al.* arXiv:1006.4087(2010)

## Cooperative model:

Model single blockade to reproduce ensemble

No additional broadening  $\Rightarrow$  EIT width limited by relative laser linewidth  $\gamma_{gr}$

Blockade dephasing rate

$$\gamma_b/2\pi < 100 \text{ kHz}$$

Non-linear density scaling:

$$\frac{1}{N_b} \times \text{[Red Peak]} + \frac{(N_b - 1)}{N_b} \times \text{[Blue Peak]} = \text{[Purple Peak]}$$

Number of atoms / blockade:

$$N_b \sim \rho R_b^3 \propto n^{*6.25}$$

$$\Rightarrow \frac{N_b^{60}}{N_b^{54}} = 2.0$$

Measured ratio  $2.6 \pm 0.7$

1. Cooperative optical non-linearity due to dipole-dipole interactions
2. Observation of cooperativity in an ultra-cold Rydberg ensemble
- 3. Towards single photon non-linearities**

Input light in coherent state  $|\alpha\rangle$

Ensemble transparent to single photon

$$|\Psi\rangle = \left| \begin{array}{c} \text{[Blue level]} \\ \text{[Red level]} \\ \text{[Green level]} \end{array} \right\rangle + \left| \begin{array}{c} \text{[Blue level]} \\ \text{[Red level]} \\ \text{[Green level]} \end{array} \right\rangle + \left| \begin{array}{c} \text{[Blue level]} \\ \text{[Red level]} \\ \text{[Green level]} \end{array} \right\rangle$$

The diagram shows three terms in a superposition, each representing a different configuration of three atoms. In each term, the atoms are shown with three energy levels: a top blue level, a middle red level, and a bottom green level. Red double-headed arrows indicate transitions between the green and red levels, while blue double-headed arrows indicate transitions between the red and blue levels. The first term shows all three atoms with a red arrow pointing up from the green level. The second term shows the first atom with a red arrow pointing up and the second atom with a blue arrow pointing up. The third term shows the second atom with a red arrow pointing up and the third atom with a blue arrow pointing up.

Measure changes in photon statistics due to cooperative interaction

➡ Single Photon source

M. Saffman and T. Walker, PRA **66**, 065403 (2002)

➡ Cooperative emission of a single photon

D. Porras and J. I. Cirac, PRL **78**, 053816 (2009)

L. H. Pedersen and K. Mølmer, PRA **79**, 012320 (2009)

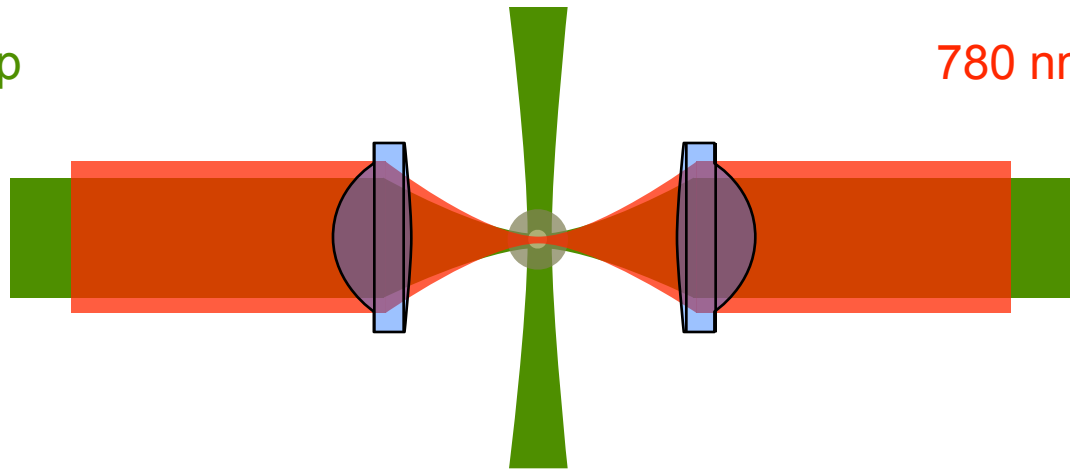

**Requirements:**

- + Large single photon Rabi frequency
- + All atoms confined within single blockade sphere  $R < R_b \sim 5 \mu\text{m}$

**Solution:** Microscopic Dipole Trap

915 nm dipole trap

780 nm probe beam

Transverse trap  $w = 6 \mu\text{m}$

## Cooperative atom-light interaction due to dipole-dipole interactions

✓ Done

## Require single blockade sphere

✓ Built

## Explore photon statistics
